- Low Cost
- Lightweight
- Low Profile
- OEM Modification Available
- 1/8 or 1/4 NPT, G, or R Threads
- Diverter Block Available

- Compact Size
- Black Anodized Aluminum Heads
- Can Be Installed as Modular or Individual
- Variety of Bowls and Drains
- Shut-Off Available

# **Miniature Particulate Filter**

# numatics

#### F12B Series

Primary air filters are designed to separate liquid, water, rust, pipe scale, and debris from air lines. They should be installed upstream of the regulator and/or lubricator to prevent contamination from reaching other components.

Water is removed mechanically by the deflector which causes the air to move in a swirling motion. The condensed water droplets are then centrifugally impounded upon the ID of the bowl then fall down past the quiet zone baffle to the water sump. Dry air passes through the sintered element utilizing depth filtration and removes debris down to specified micron size.

#### **Features**

- 5 micron sintered elements standard
- Can be installed as modular or individual unit
- Includes screws and o-rings for modular connection
- Polycarbonate bowl standard

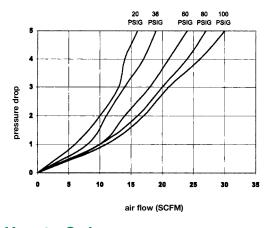

F12B-02 pictured

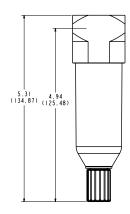

# **Specifications**

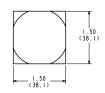

Bowl	Polycarbonate Bowl	Metal Bowl
Temperature Range °F (°C)	40-120 (4-50)	40-120 (4-50)
Max. Pressure PSIG (BAR)	150 (10)	200 (14)
Weight lbs. (kg)	0.22 (0.10)	0.25 (0.11)

# **Miniature Coalescing Filter**

#### F12 Series

The coalescing filter is utilized when either clean air is required or longer component life is desired. This type of filter removes water and oil aerosols. It works differently than the particulate filter; dirty air enters the element from the center and passes through a field of glass fibers which cause the aerosols to form into droplets which are heavier than the surrounding air. The droplets grow larger as they pass through the element and gravity causes the oil drops to drain to the sump of the bowl. To maximize the life of a coalescing filter it should always be used after a 5 micron particulate filter or with the optional prefilter.

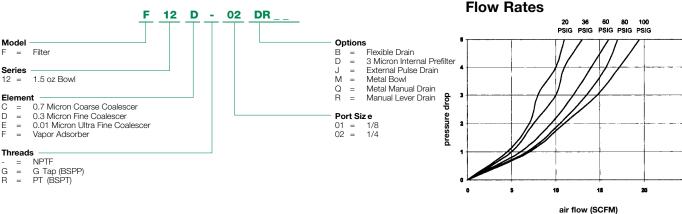

#### **Features**

- Cartridge element design
- Inner and outer support cores prevent element from crushing in either flow direction
- Can be installed as modular or individual unit
- Includes screws and o-rings for modular connection
- Polycarbonate bowl standard

# **Specifications**

Bowl	Polycarbonate Bowl	Metal Bowl
Temperature Range °F (°C)	40-120 (4-50)	40-120 (4-50)
Max. Pressure PSIG (BAR)	150 (10)	200 (14)
12 Series Weight lbs. (kg)	0.23 (0.10)	0.26 (0.12)

#### **How to Order**

#### **Recommended Uses**

C grade element, identified by its blue drain layer, is a coarse filter for large amounts of water, rust, pipe scale, and hydrocarbons. Excellent for environments that have severe contamination. Can be used for lubricated or 'dry' systems. Ideal for mainline filtration of plant air.

D grade element, identified by its green drain layer, is a fine filter for cylinder or valves - especially when the circuit is being run without lubrication ('dry'). Excellent filter for desiccant or regenerative style dryers.

E grade element, identified by its red drain layer, is an ultra fine filter for oil-free instrumentation air, blow molding, food and drug packaging, electronics applications, and other applications requiring maximum contamination removal.

Figrade element, identified by its white drain layer, is an adsorbing filter that utilizes activated carbon to deodorize compressed air. Typically it is used to protect worker environments, food and drug applications, and instrumentation for analytical instruments. Life expectancy is approximately 3 months at rated flow.

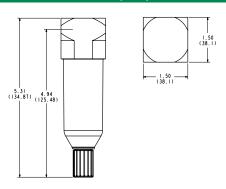

#### Prefilter Option - Suffix 'D'

Models using the C, D, or E grade elements can be equipped with an optional 3 micron internal prefilter. The prefilter provides additional protection for the fine borosilicate fibers. For most applications, a separate 5 micron particulate filter is not required.

# **Miniature Regulator**

#### **R12 Series**

Regulators are used to reduce pressure to a required working pressure. They consist of a diaphragm which floats between a main spring (top) and a valve (bottom). By turning the adjustment handle clockwise, the main spring is forced onto the rubber diaphragm which, in turn, is pressed onto the valve stem. When the spring pressure becomes greater than the air pressure in the control chamber below the diaphragm, the valve is forced down and flow begins. As flow continues, the pressure begins to build and air, via the aspirator tube, fills the control chamber and forces the diaphragm upward. As forces balance, the small spring under the valve piston causes the valve to close. The cycle continues in a balanced process of reducing or increasing flow based upon the downstream pressure.

R12R-02 pictured

#### **Features**

- · Locking adjustment knob
- Three different pressure ratings available
- · Relieving or non-relieving models
- · Can be installed as modular or individual unit
- Standard output pressure 0-125 PSIG

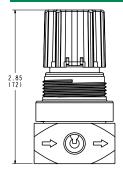

### Piston Operator - Style 'P'

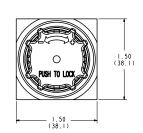

The 12 Series is offered with an optional Piston Operator. A Piston Regulator will achieve extremely high cycle rates with limited wear.

# **Specifications**

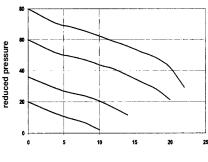

Temperature Range °F (°C)	40-120 (4-50)

# Miniature Particulate Filter/Regulator

#### **P12B Series**

The integral part of the filter/regulator ('piggyback') is a two station component designed to filter and regulate compressed air when cost and space are of primary concern. As wet, dirty air enters, it immediately flows through the air deflector, causing the air to move in a swirling motion. After condensed water is centrifugally removed, air passes through the filter and into the regulator. The high pressure of the air is systematically reduced via the adjustment spring and valve and exits the housing as clean and dry air that is ready to work at the specified pressure.

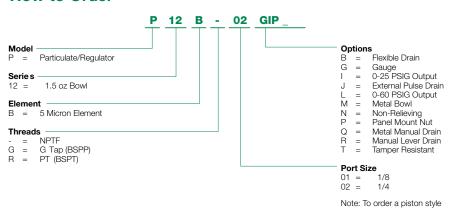

### **Features**

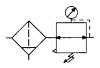

- 5 micron element standard
- · Can be installed as individual or modular unit
- · Non-rising knob
- Optional metal bowl
- Standard output pressure 0-125 PSIG

# **Specifications**

Bowl	Polycarbonate Bowl	Metal Bowl

# **Miniature Coalescing** Filter/Regulator

#### C12 Series

The Coalescing Filter-Regulator is designed to provide superior filtration and regulation in one compact housing. It combines a multiple support cartridge style borosilicate glass element with a pilot balanced regulator to assure the maximum performance of downstream components. Available with four different element grade choices, the C Series Coalescing Filter-Regulator can be outfitted to attack and remove the exact type of contamination that is critical to a specific application.

#### **Features**

- Cartridge element design
- Inner/outer support cores prevent element from crushing in either flow direction
- Can be installed as individual or modular unit
- Four element grades available
- Non-rising knob

Models using the C, D, or E grade elements can be equipped with an optional 3 micron internal prefilter. The prefilter provides additional protection for the fine borosilicate fibers. For most applications, a separate 5 micron particulate filter is not required.

# **Miniature Lubricator**

# **numatics**\*

#### L12L Series

Usually mounted third in the FRL Series, the lubricator is designed to inject oil aerosols into the airstream of a pneumatic circuit. As air flows from the regulator, some air is diverted from the main orifice to pressurize the bowl. This forces oil up the siphon tube past a flow check and into the integral valve/sight dome. The oil film then drops through the valve and into the atomization chamber at a rate that is automatically proportional to the air flow. This virtually eliminates the need for readjustment.

#### **Features**

- Lubrication to begin at less than 2 SCFM
- Tamper-resistant knob standard
- Optional metal bowl
- · Can be mounted as individual or modular unit
- Button head fill optional
- Atomizing chamber develops longer life aerosols

# **Shut-Off Valve and Diverter Block**

#### **Shut-Off Valve**

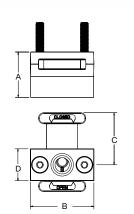

#### **VS12 Series**

The 12 Series Shut-Off Valve is an easy and inexpensive way to add shut off capability to an FRL. The valve includes a lockout feature designed for a padlock to prevent unauthorized downstream pressurization during maintenance. The shut off valve is usually mounted first in the assembly.

Max. inlet pressure: 200 PSI (13.7 bar)

- Relieves downstream pressure when closed
- · Lockout feature prevents unauthorized pressurization of system
- Can be mounted as individual or modular unit

\*NOTE: When ordering the 12 Series Shut Off Valve as a stand-alone component, add the suffix 'E' to the model number.

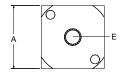

#### **Diverter Block**

#### **DK12 Series**

Designed to give FRLs total versatility, the diverter block mounts directly inline with the FRL combination. Additional components can then be manifold mounted in a compact manner that doesn't cause excessive pressure drop. There are two available ports per unit; both are tapped for standard service.

Max. inlet pressure: 200 PSI (13.7 bar)
